

WINDOW BLIND CUTTING MACHINE

ABSTRACT OF THE DISCLOSURE

A window blind cutting machine includes a machine base; two cutting units
5 respectively disposed at two ends of the machine base, each cutting unit having a cutter
movable along a respective cutting path across a longitudinal axis of the machine base
for cutting off a part of the window blind carried on the machine base that protrudes
over a respective reference line based on the cutting path, two measuring devices
respectively disposed at an outer side of each cutting unit for measuring the part of the
10 window blind that protrudes over the reference line, and two inner measuring rules
arranged in parallel to the longitudinal axis and respectively extended in reversed
directions from one cutting unit toward the other and having a respective true-zero
disposed at the reference line, for measuring the length of the window blind from the
reference line.
